

This residential project was done in Pincourt, Quebec. There was a shaded area between the house and the fence where the grass would not growbut weeds grew profusely!

The only solution was to install Biobarrier.

Biobarrier was installed on the side of the house and was extended to the base of the tree and shrub in order to create a flower bed.

Plastic pegs supplied with each roll were used to secure the Biobarrier in place.

A thickness of 2" to 3" of mulch was used to cover the Biobarrier membrane.

Flowers and stones were added to beautify the area even more.....and no weeding for at least the next 15 years!

Biobarrier's performance is guaranteed by the manufacturer for **15** years, but you can expect it to last for **25** and even **30** years!
